

Annexair heading into the Future!

DRUMMONDVILLE (Quebec) – Annexair is taking a leap into the future with its new \$28 million investment, manufacturing the next generation of Sustainable Green products. This new 290,000 sq. ft. manufacturing facility, located 70 miles east of Montreal, will be the corner stone of a vast line of new innovative products.

Production capacity will increase threefold, allowing Annexair to serve the increase in product demand. The new facility will allow Annexair to double its sales within the next five years.

Victim of its own success in the United States, Annexair was faced with multiple options to grow its operations. Annexair decided to remain in Quebec, to bring its production in a new High-Tech 4.0 Smart Factory while keeping its skilled professionals and provide a smooth transition to ensure customer satisfaction.

Invests \$28 million in a new state-of-the-art plant

Annexair currently has five locations to support its current operations. The new facility will enable the company to centralize all activities and improve productivity, logistics and reduce operational costs.

Inspired by the Industry 4.0 revolution, the new facility processes will be fully automated, innovative and ecological. It will incorporate its new line of sustainable green products, which will be a first of its kind in the HVAC sector. The automation process is specifically designed for Annexair to evolve from its current Thermo-Composite casing to its second generation recycled Bio-Composite casing.

Annexair is scheduled to begin transition fall of 2018 and plans to be fully operational in 2019.

*A bright future in
